Abstract not available for JP9510161T

Abstract of correspondent: **DE4408732**

The invention relates to a wiper arm for a windscreen wiper system, especially for motor vehicles, which is to be secured in rotation via an aperture (7) in its securing member (1) to a drive spindle (8) by means of a securing device in the form of a securing nut (9) or screw (13) acting axially on the drive spindle (8). In order to simplify the fitting of the wiper arm on the drive spindle (8) and ensure simple removal of the wiper arm from the drive spindle (8) without additional aids and without damaging the wiper arm on the drive spindle (8), the securing device (9, 13) is held captive at least approximately in the fitting position on the securing member (1) in such a way that the wiper arm can be withdrawn from the drive spindle (8) by means of the securing device (9, 13).
